

NATIONAL TRANSPORTATION SAFETY BOARD  
Vehicle Recorders Division  
Washington, D.C. 20594

February 15, 2002

**Specialist's Factual Report of Investigation**  
**Digital Flight Data Recorder**

NTSB Number:  
**DCA01MA065**

**A. EVENT**

Location: Shanksville, Pennsylvania  
Date: September 11, 2001  
Aircraft: B-757-200, N591UA  
Operator: United Airlines

**B. GROUP**

N/A

**C. DETAILS OF INVESTIGATION**

In support of the Federal Bureau of Investigation's (FBI's) investigation into the terrorist act of United Airlines Flight 93, which crashed in Shanksville, Pennsylvania, on September 11, 2001, the NTSB Vehicle Recorders Division received the following solid state flight data recorder (SSFDR) on September 13, 2001:

Recorder Manufacturer/Model: **Allied Signal SSFDR**

The SSFDR was examined upon receipt. The recorder displayed evidence of impact damage (figure 1). The memory board was removed and also showed signs of impact damage (figure 2).

Figure 1

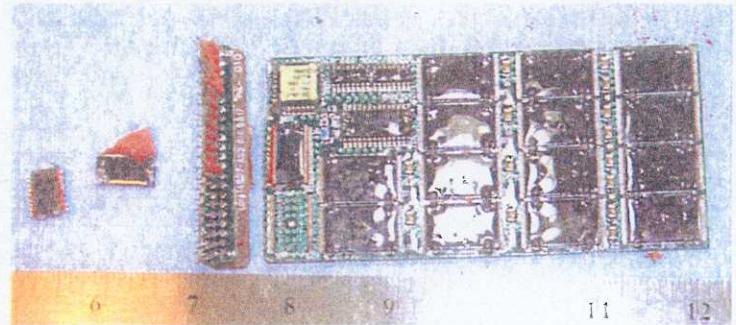

Figure 2

The memory board was taken to Honeywell facilities in Redmond, Washington for evaluation and downloading since the extent of the damage was not known. The data were extracted and electronically transferred to Safety Board headquarters. The transcribed data were reduced from the recorded binary values (0's and 1's) to engineering units (for example feet, knots, degrees, etc.) using conversion formulas obtained from United Airlines.<sup>1</sup> The transcribed data were processed by the Safety Board's Recovery Analysis and Presentation System (RAPS), which converted the raw data to engineering units and presented it in tabular and graphic form. An examination of the recovered data indicated that the recorder operated normally.

Only validated parameters are included in the plots and tabular data in this report. A list of these parameters is in Attachments I-1 to I-7. The remaining parameters either were not recorded properly or were not confirmed to have been recorded properly, and are not included in this report. A list of these parameters is in Attachments I-8 to I-10.

### Recorder Description

This model SSFDR accepts serial bit stream data in an ARINC 573/717<sup>2</sup> format at a rate of 64 12-bit words per second. The SSFDR uses solid-state flash memory technology as the recording medium. The recording is stored in a crash survivable memory unit. A minimum of the last 25 hours of operational data is retained on the recording medium.

<sup>1</sup> United Airlines provided their custom data frame which is based on Boeing's 757-4 data frame, Attachment IV: 757UALmap.xls.

<sup>2</sup> Flight Data Acquisition and Recording System Characteristic, Published by Aeronautical Radio, Inc. (ARINC), 2551 Riva Road, Annapolis, Maryland

The Digital Flight Data Acquisition Unit (DFDAU) provides a means of gathering, conditioning, and converting flight data parameters to digital data. The DFDAU provides a serial binary digital data stream to the SSFDR at a rate of 768 bits/sec. A binary, or logical one, is represented by a voltage transition between clock transitions.

The DFDAU input signals are time division multiplexed, with parameter identification established by means of position or time slot addresses in the serial data stream output. This output is a continuous sequence of four-second data frames. Each frame consists of four subframes of 64 separate 12-bit words, with the first word containing a unique 12-bit synchronization (sync) word identifying it as subframe 1,2,3, or 4. The data stream is "in sync" when successive sync words appear at the proper 64-word intervals. If the data stream is interrupted, sync words will not appear at the proper interval or sequence, and the time reference will be lost until the subframe pattern can be reestablished.

### **Time Correlation**

The SSFDR data were correlated to local time (Eastern Daylight Time (EDT)). See the Time Correlation Report for further details on the correlation between SSFDR and local time.

### **Data and Graphs**

Attachments II-1 to II-22 contain plots of those parameters that were recorded and validated. The timeframe of the plots is from 8:39:00 EDT to 10:04:00 EDT, with the last recorded data shown at 10:03:10 EDT.

The raw file for this data set contained 2 additional subframes (seconds) of data. The first of these two contained data in words 1, 2, 3, and 4 but the rest of the subframe were zeros. Word 1, which was a sync word, and word 2, which contained a vertical acceleration value of .640 g's, appeared to be valid data. The remaining 2 words could

not be validated and the remainder of the frame was considered invalid. The next subframe was determined to be a repeat of the previous subframe and was considered invalid<sup>3</sup>. These 2 subframes were not included in the plotted or tabular data.

The data plotted in Attachment II are available in tabular format as a comma delimited (\*.csv) files in Attachment III. The tabular data are separated into 4 files alphabetically based on the parameter names.

Erin M. Gormley  
Aerospace Engineer  
Vehicle Recorders Division

Attachments I-1 to I-10	Parameter Listings
Attachments II-1 to II-22:	Plots of SSFDR Data
Attachment III (electronic):	DCA01MA065 tabular csv files
Attachment IV (electronic):	757UALmap.xls

---

<sup>3</sup> This condition, where the last recorded subframe is repeated, is a known bug which occurs as a result of the SSFDR download software.
